

L0 Decide

Business & Solution Design

- Governing requirements, constraints and policy for the case (design time, not a runtime path)

L1 Interact

Analyst interface

- Submit metric request
- Present result and explanation

L2 Protect

Access gate

- Signed session, request validation
- Per-principal rate limit
- Establishes identity and trace context

L3 Coordinate

Goal-directed agent runtime

- Receives a goal, not a procedure; plans the next action from accumulated observations
- Discovers candidates, selects, grounds, invokes computation, requests explanation, terminates
- Holds execution-local working context and bounds the execution

T2: identity and authority context;
L5/L6 retain resource-specific enforcement

L4 Infer

Model access

- Explanation provider
- Output contract validation

L5 Ground

ESG knowledge graph

- Metric discovery (CQ3)
- Definition, model, provenance
- Queried through CQ1-CQ7

L6 Act

Metric-computation services

- Resource-specific authorization
- Deterministic computation
- Result with provenance

L7 Decouple

Async & event infrastructure

- Not required by the synchronous case

L8 Operate

Deployed service platform

- Hosts the participating components

L9 Improve

Evaluation & observability

- Not exercised by the traced execution

→ request / intent → response / observation - - - → context propagation *dashed box: not instantiated in this case*

Recorded execution: 11 interaction occurrences realizing 5 of the 8 defined interaction types (T1-T5); T6-T8 not exercised.

Across 5 goals the same coordinator produced 3 distinct action sequences and occurrence counts of 2, 6, 8.

Both realization mechanisms — the deployed service interface and the same services imported in process — produce identical results.
